

Platform Download Metrics

Eleven downloads driven through the app's own `/api/download` endpoint, every URL confirmed live by a metadata pass beforehand. Seven completed. Because the media ranges from an 8-second clip to an 18-minute film, throughput and time-per-minute-of-media are reported alongside raw elapsed time, which alone would not compare.

Run 27 Aug 2026, 12:0x
yt-dlp 2026.08.19
curl_cffi 0.16.2 (new)
Requested 360p video+audio
Cap 240 s per URL
ffmpeg still not installed

64%^{19pp} PASS RATE 7 of 11 · was 55% on same set	124.8^{MB} RETRIEVED across 7 successes	0.50^{MB/s} AGGREGATE THROUGHPUT successes only	355.7^s TOTAL WALL CLOCK 249.7 s in successes	3.7^s OVERHEAD FLOOR fastest end-to-end run	2164 PROGRESS EVENTS 2062 from Dailymotion alone				
FROM	URL	STATUS	TIME	SIZE	THROUGHPUT	S / MIN MEDIA	PROGRESS EV.	NOTE	
Archive.org Keaton's <i>Cops</i> (1922) · 18 min	REUSED	✓ COMPLETED	53.1 s	67.07 MB	1.26 MB/s		2.9	50	Most efficient per minute of media; the only run where transfer, not overhead, dominates.
Pinterest Origami pin · 58 s	REUSED	✓ COMPLETED	10.5 s	17.55 MB	1.67 MB/s		10.9	15	Fastest throughput of the run. Pre-merged MP4, so the app's selector matched.
Dailymotion Euronews bulletin · 12 min	NEW	✓ COMPLETED	164.9 s	35.88 MB	0.22 MB/s		14.1	2062	The only platform the URL swap recovered. HLS fragments, hence 2062 progress events and low throughput.
Streamable test clip · 12 s	REUSED	✓ COMPLETED	5.0 s	2.90 MB	0.58 MB/s		25.0	11	Small file; time is mostly fixed extraction cost.
Twitch NASA clip · 8 s	NEW	✓ COMPLETED	5.1 s	0.84 MB	0.16 MB/s		38.2	10	Worst s/min figure purely because the clip is 8 s. Overhead-bound, not slow.
SoundCloud royalty-free CC track · 34 s	NEW	✓ COMPLETED	7.4 s	0.52 MB	0.07 MB/s		13.0	10	Already MP3-encoded, so no ffmpeg needed. Audio requiring transcoding remains untestable.
Instagram short clip	REUSED	✓ COMPLETED	3.7 s	0.04 MB	0.01 MB/s		—	6	Fastest end-to-end, so it sets the ~3.7 s overhead floor. <code>/api/info</code> still crashes on this URL.
YouTube Big Buck Bunny, official CC-BY	REUSED	✗ ERROR	85.4 s	—	—		—	0	ENVIRONMENT + APP <code>Requested format is not available.</code> Faster than run 1's 120 s cap but same cause: no JS runtime, so only HLS/DASH exposed.
Vimeo current Staff Pick · 16 min	NEW	✗ ERROR	5.9 s	—	—		—	0	PLATFORM Impersonation now works, but Vimeo's web client requires login. Confirmed on two unrelated videos.
Reddit r/videos post · 12 s	REUSED	✗ ERROR	6.8 s	—	—		—	0	APP CODE 11 healthy formats, selector matched none. A new URL cannot fix this.
BiliBili Blender open-movie OST · 2 min	NEW	✗ ERROR	7.9 s	—	—		—	0	APP CODE Fresh URL, identical failure. DASH-only, so the selector matches nothing.
11 platforms · 7 passed		64% pass	355.7 s	124.80 MB	0.50 MB/s agg.		2164		

Reading throughput. MB/s is only meaningful where the file is large enough for transfer to dominate. Instagram's 0.01 MB/s reflects a 40 KB file finishing inside the fixed extraction cost, not a slow platform; the same applies to SoundCloud and Twitch. Archive.org and Pinterest are the two figures that genuinely measure transfer. Likewise *s/min media* penalises short clips, since every download pays the ~3.7 s floor regardless of length. Times were measured over one residential connection in a single pass, with no repeats, so treat them as one sample rather than an average.

What changed against run 1

Same eleven platforms, so this is like-for-like. Fresh URLs plus the `curl_cffi` install were the only variables; app code was untouched.

Platform	Run 1	Run 2	Movement
Dailymotion	ERROR	COMPLETED	RECOVERED dead URL replaced
Vimeo	ERROR	ERROR	Cause moved: impersonation → login wall
YouTube	ERROR	ERROR	Unchanged cause; 120 s → 85.4 s
Reddit	ERROR	ERROR	Unchanged; app selector
BiliBili	ERROR	ERROR	Unchanged despite new URL
Archive.org	COMPLETED	COMPLETED	Held; 1.33 → 1.26 MB/s
Pinterest	COMPLETED	COMPLETED	Held; 11.6 → 10.5 s
Streamable	COMPLETED	COMPLETED	Held; 5.5 → 5.0 s
Instagram	COMPLETED	COMPLETED	Held; 4.7 → 3.7 s
SoundCloud	COMPLETED	COMPLETED	Held, different track
Twitch	COMPLETED	COMPLETED	Held, different clip
Pass rate	6/11 · 55%	7/11 · 64%	+1 platform, +9pp

Scope. TikTok, X / Twitter and Facebook were not tested in this run: no discoverable URL was available for them and no replacement was supplied, so they are absent rather than failed. One URL per platform means a pass reflects that URL, not the platform as a whole. Playlists, age-restricted and geo-blocked content, and the audio-only path remain untested, and audio cannot be assessed until ffmpeg is installed. All downloaded files were deleted after measurement; raw figures are in `run2-results.json` beside `platform-test-results.json` from run 1.

Remaining Failure	Count	Can a New URL Fix It?
App format selector Reddit, BiliBili	2	No. Both extractors returned 11 healthy formats. <code>best[height<=360]</code> wants a pre-merged file that DASH platforms no longer publish. Needs the selector change plus ffmpeg.
Missing JS runtime YouTube	1	No. Environment, not content. <code>--js-runtimes node</code> already proven to resolve formats on this exact URL.
Platform login wall Vimeo	1	No. Vimeo's web client now demands credentials; reproduced on two unrelated videos including the repo's own test URL. Needs cookies.
All remaining failures	4	None are URL-related. Two are ours to fix, one is a dependency, one is Vimeo's policy.

Conclusion. Swapping in eleven freshly validated URLs raised the pass rate from 55% to 64%, and that entire gain is one platform: Dailymotion, whose previous URL had been deleted upstream. Every other outcome held exactly. This is the useful result — it establishes that the remaining failures are not bad test data. Two are the app's format selector, one is a missing dependency, and one is Vimeo changing its access policy. `curl_cffi` did clear Vimeo's impersonation barrier, which was real progress, but a login wall sits immediately behind it.
